# INTRODUCTION

The lowbush blueberry has developed from humble beginnings into one of the most important horticultural crops in Nova Scotia. The large scale commercial development of today had its beginnings in the late forties and early fifties. Since then, the industry has steadily expanded. Lowbush blueberries are the No.1 fruit crop in the province in terms of total acreage, export sales, and total value to the province's economy.

In 1953, provincial production was 1,125,000 pounds with a farm value of \$152,000. The five-year average production from 1986 to 1990 was 19,313,661 pounds with a farm value of \$10,043,103 and a total to the province's economy of over \$30,000,000. In 1990 and 1991, Nova Scotia produced almost 28,000,000 lbs of lowbush blueberries, and in 1992 33,000,000 lbs. were produced with a farm gate value of \$16,500,000 and a total value to the economy in excess of \$45,000,000. The 1993 crop was 30,300,000 lbs.

# **SECTION 1 – PRODUCTION**

### PRODUCERS AND ACREAGE

There are over 1,000 producers in the province and about 28,000 acres in production. Most growers operate their fields on a two-year pruning cycle, with about half of their total acreage in crop each year. Acreage per grower varies from as low as one acre to well over a thousand acres for a few large producers. Thus, annual production per grower can vary anywhere from a low of a few hundred pounds to a high of 2,000,000 pounds or more.

# **PRODUCTION FIGURES**

The table below gives annual lowbush blueberry production figures in Nova Scotia for the past thirty-eight years. The table on the following page gives five-year production figures.

Annual Lowbush Blueberry Production Figures for Nova Scotia

(lbs.)	(lb	s.)		
Year	Production	Year	Production	
1956	4,020,000	1974	7,557,000	
1957	4,800,000	1975	9,928,632	
1958	3,000,000	1976	6,842,349	
1959	5,200,000	1977	8,202,370	
1960	5,400,000	1978	11,618,207	
1961	5,700,000	1979	10,723,011	
1962	7,400,000	1980	8,348,407	
1963	7,000,000	1981	12,866,140	
1964	5,100,000	1982	14,113,780	
1965	7,000,000	1983	19,502,395	
1966	7,600,000	1984	15,107,326	
1967	11,500,000	1985	18,950,760	
1968	2,100,000	1986	16,212,357	
1969	8,882,000	1987	13,525,056	
1970	8,200,000	1988	22,005,048	
1971	7,100,000	1989	16,831,560	
1972	9,897,000	1990	27,994,286	
1973	10,075,000	1991	27,940,676	
			1992	33,007,621
	1993	30,3	307,975	

Average Production Figures - Nova Scotia (1961 to 1993)

Period Average Annual Production	
----------------------------------	--

1961 - 1965	6,440,000 lbs.
1966 - 1970	7,656,400 lbs.
1971 - 1975	8,911,526 lbs.
1976 - 1980	9,146,868 lbs.
1981 - 1985	16,108,080 lbs.
1986 - 1990	19,313,661 lbs.
1991 - 1993	30,418,757 lbs.

The overall steady increase in production over the past thirty years has been due to a strong production base of privately owned land; continuous research and promotion of improved cultural practices by

government; aggressive and innovative industry entrepreneurs; ample modern processing facilities; a strong and active producers' association and steadily expanding markets.

Years of unusually high production have been mainly due to a particularly favorable growing season with an abundance of native pollinators and a good supply of moisture at critical times during the growing season. The one year of exceptionally low production (1968) was due to a very late spring frost combined with a prolonged summer drought.

### **PRODUCTION AREAS**

For the purpose of presenting a more accurate picture of lowbush blueberry production in Nova Scotia, the province may be divided into five production areas:

1) Cumberland County 2) Central Nova Scotia - includes counties of Halifax, Colchester and Hants 3) Eastern Nova Scotia - includes counties of Guysborough, Antigonish and Pictou 4) Western Nova Scotia - includes counties of Kings, Yarmouth, Digby, Lunenburg, Queens, Shelburne and Annapolis 5) Island of Cape Breton Each production area has specific conditions or factors that have a bearing on blueberry production, yields and losses.

About 75 percent of our present production comes from Cumberland County. Although there is still undeveloped acreage which could be brought into production in this county, increased production here will result mainly from improved cultural practices. Yields are generally higher than other areas of the province. This is because development of large acreages took place first in this county, and many fields have been continually improved by a good cultural program over a long period of time. Also, the central part of this county has nearly ideal soil and climatic conditions for good blueberry production.

The central region has developed steadily during the past several years. This area has good climatic conditions and a good natural acreage base. Production from this region should continue to increase as more fields are developed and existing acreage is gradually improved.

A continued increase in the development and improvement of acreage in eastern Nova Scotia has also occurred during the past several years. Most fields in Pictou and Antigonish counties and the northern part of Guysborough County have very few weed problems and climatic factors appear favorable for development. Production potential on the large tracts of barren land in the southern and coastal areas of Guysborough County is not great because of climatic factors (i.e. short growing season, severe winterkill) and extremely rough terrain. Only a few of these fields are burned on a regular basis, and usually this is the only cultural practice followed. These fields are rough and rocky and, in most cases, they are owned by the province (Crown lands). With no private ownership and severe production constraints, there is lack of individual initiative to develop fields for higher production.

In the western part of the province (from Hants County westward), blueberry acreage has been developed mainly in Annapolis, Queens, Lunenburg and Yarmouth counties. There are over 1,000 acres presently in production and many more potential acres which could be developed. This area has the natural advantage of a longer growing season. However, fields have historically been plagued with rocky rough terrain and more weed problems than in other areas of the province. With the introduction of new and improved methods of weed control and land improvement, there is a growing interest in developing new acreage in these counties.

Cape Breton Island has historically never produced satisfactory commercial yields. For years, this was attributed mainly to lack of sufficient heat units during the growing season in coastal areas where commercial development has been attempted. Several inland locations on the island are currently being developed for commercial blueberry production. It now appears that some of these areas have good potential, and that lack of a proper long-term cultural and management program may have been the limiting factor in past commercial development attempts.

# **PRODUCTION METHODS**

Growing a commercial crop of lowbush blueberries has developed into a fairly complex operation. A grower with any significant acreage is involved with various production activities from early spring until late fall. While this booklet is not intended as a production manual, a brief description of the seasonal activities of the blueberry grower is presented here to give a capsule picture of the production methods used with this crop.

### PRUNING

Pruning lowbush blueberries is done by flail mowing or burning in either the fall or early spring. Pruning gets rid of old growth and promotes the growth of vigorous new shoots which will produce a high yielding crop the following year. Usually, one-half of the total acreage is pruned each year. Burning is usually done with oil or gas burning machines. A few growers spread hay or straw in the fall and burn fields in the spring without the use of a machine. Flail mowing is cheaper than burning and is rapidly increasing in popularity as a pruning method on level ground. The blueberry plant produces only vegetative shoots the first season following pruning. The second year, blossoms and fruit are produced.

# INSECT AND DISEASE CONTROL

At various times during both the sprout (first) and cropping (second) years of growth, sprays may need to be applied to control insect and disease pests. These materials are usually applied with ground spraying equipment, such as boom or mist blower sprayers.

### WEED CONTROL

Because of the semi-cultivated condition of blueberry fields, weed control is a continuous problem. The weed control program for most fields involves an overall pre-emergent spray in the spring of the sprout year followed by spot spraying to control escape weeds. Some spot treating of weeds may also be done following harvest during the crop year. Bush type weeds are cut and treated with herbicides while softer weeds are sprayed with back sprayers or tractor-mounted boom sprayers.

### POLLINATION

Lowbush blueberry flowers must be insect pollinated. In order to ensure an adequate pollinating force, many growers place colonies of honeybees in their fields during the bloom period (three weeks during June). The hives of bees are usually removed once the bloom period is over.

### HARVESTING

Harvesting on crop fields begins in mid- August. Berries are harvested either by hand raking or the use of mechanical harvesters. Harvesting with hand rakes involves organizing one or more picking crews to rake the berries which are then delivered to a collecting station or processing plant. Fields are divided into picking lanes with one raker assigned to each lane. Field supervisors, truckers, field weighers, stringers, etc. must be hired for large operations. If only a small acreage is involved, the grower may perform most of these duties himself. Harvesting usually lasts from one to four or five weeks depending on weather conditions and the acreage to be harvested.

In 1984, the first commercially successful mechanical harvesters were used on about 20 farms. There are now over 250 of these machines in use. A harvester can pick up to six ton of berries per day in high-yielding fields. However, their use is restricted to fields that are quite smooth and relatively free of weed growth. Harvesting costs with the machine average about half the cost of harvesting with a raking crew. In 1993, it is estimated that 50 to 60 percent of the provincial crop was machine harvested. It is anticipated that mechanical harvesters will be used on more acreage each year.

#### OTHER

Besides these essential operations, many growers are involved in clearing new land for production and improvement of existing fields through fertilizing, drainage, constructing firebreaks, land leveling, etc.

#### **PRODUCTION AND HARVESTING COSTS**

The cost of producing and harvesting a pound of blueberries varies greatly from one grower to another depending on the program he follows, the yield per acre he obtains from his field, and whether his land can be mowed and mechanically harvested. As the yield per acre increases, the unit costs decreases accordingly. Most growers feel their cost for production and harvesting using traditional burning and hand harvesting is somewhere between 35 and 40 cents per pound.

The tables to follow outline costs for a complete production program. Tables I and II give typical costs when the plants are pruned by burning and hand harvested. Comparable costs for pruning by flail mowing and mechanical harvesting are given in Tables III and IV. By using these figures, a grower can obtain estimates of the cost of

producing and harvesting a pound of blueberries and make a comparison of costs as they are affected by different yields. These figures are considered by extension workers to be realistic even though costs do vary considerably among different growers.

#### Table I - PRODUCTION AND HARVESTING COSTS USING BURNING AND HAND HARVESTING Production Cost Per Acre Harvesting and Handling Costs Pruning (Burning) \$ 130.00 Harvesting & Supervision \$.15 to \$.20/lb Fertilization 30.00 Equipment & Transportation \$.02/lb Insect Control 20.00 Disease Control 40.00 TOTAL \$.17 to \$.22/lb Weed Control 70.00 Pollination 70.00 Taxes, Machinery, & Other Overhead Costs 40.00

TOTAL \$ 400.00

# Table II - VARIABILITY OF TOTAL PRODUCTION AND HARVESTING COSTS PER POUND DUE TO YIELD VARIATIONS (Based on Table I Cost Figures)

Yield	Production Cost	Handling Costs*	Total Cost
1,000 lbs/acre	40.0 cents/lb (\$400 per acre)	22 cents/lb	62.0 cents/lb
1,250 lbs/acre	32.0 cents/lb (\$400 per acre)	21 cents/lb	53.0 cents/lb
1,500 lbs/acre	26.6 cents/lb (\$400 per acre)	20 cents/lb	46.6 cents/lb
1,750 lbs/acre	22.8 cents/lb (\$400 per acre)	19 cents/lb	41.8 cents/lb
2,000 lbs/acre	20.0 cents/lb (\$400 per acre)	18 cents/lb	38.0 cents/lb
2,250 lbs/acre	17.7 cents/lb (\$400 per acre)	17 cents/lb	34.7 cents/lb
2,500 lbs/acre	16.0 cents/lb (\$400 per acre)	17 cents/lb	33.0 cents/lb
2,750 lbs/acre	14.5 cents/lb (\$400 per acre)	17 cents/lb	31.5 cents/lb
3,000 lbs/acre	13.3 cents/lb (\$400 per acre)	17 cents/lb	30.3 cents/lb

\* Harvesting and handling costs have been varied from 22 cents to 17 cents to reflect the influence of good yields in lowering harvesting rates.

Table III - PRODUCTION AND HARVESTING COSTS USING FLAIL MOWING AND MECHANICAL HARVESTING

Production Cost Per Acre

\*Harvesting and handling costs have been varied from 12 cents to 10 cents to reflect the influence of good yields in lowering harvesting rates

Production costs vary considerably from grower to grower, depending on the condition of his fields, his location and his management program. The harvesting and handling cost per pound for hand raking varies with labor availability,

yield per acre and field conditions. Mechanical harvesting costs will also vary depending on yield and field conditions. growers with low yielding or poorly managed fields must pay higher harvesting costs than those with weed free, high yielding fields. Because of the great variations between growers' costs, it is difficult to determine meaningful average production and harvesting costs for growing lowbush blueberries. Each operation must be assessed on the basis of its production, location, yield, management plan and the variable cost factors mentioned on the preceding page.

The form below could be used by all growers in order to determine their own production and harvesting costs.

Production Cost Per Acre

Pruning	\$

Supervision	cents
Supplies & Equipment	cents
Transportation	cents

TOTAL	cents	Per	Pound

The production cost per pound is calculated by dividing the yield per acre into the production cost per acre. By adding this cost to the harvesting cost, the total production and harvesting cost per pound is obtained. This can then be compared to the market price for berries to determine profit or loss per pound of berries produced (see form on next page).

# **SECTION II - MARKETING**

# THE MARKETING SYSTEM

The bulk of Nova Scotia's annual lowbush blueberry crop is sold to processors and frozen for eventual resale to blueberry product manufacturers. A well-defined marketing system has evolved for getting the crop from the field to the end user. To help in describing this system, there are several terms which should be defined.

- 1. A grower is a person who grows and harvests blueberries. He may or may not be a buyer or processor.
- 2. A buyer is a person who buys blueberries from the grower and sells to the processor. He is usually, but not necessarily, a grower himself.
- 3. A processor is a person who buys blueberries from the buyer or directly from the grower. He processes (freezes) these berries at this plant. They are then either resold immediately or stored and held for future sales. Some processors are also large growers.
- 4. A manufacturer is a person who buys blueberries (mostly frozen but sometimes fresh) for use in the manufacturing of blueberry pies, tarts, muffins, etc., or other manufactured products.

The buyer, or middleman as he is sometimes called, is an important link in the marketing chain and has done a lot to develop the blueberry industry in Nova Scotia. He has helped to create a ready market for many small growers and has also provided them with a great many necessary custom services. There are approximately 30 buyers in the province of Nova Scotia at present (1991). Most of these buyers are also large growers. Most buyers supply the necessary harvesting and marketing equipment, such as rakes, pails and field cleaners, to growers. Sometimes, they provide picking crews (paid for by growers) to harvest the crop. Boxes for harvesting and transporting the berries are provided by the processor Most buyers and processors own burners and flail mowers and will custom-prune fields. Many buyers and processors also provide services such as weed control work, spraying and fertilizing, hives for pollination, etc. on a custom basis. All of this, of course, means that each grower does not have to invest a lot of money in supplies and equipment.

Most buyers have collecting points or receiving stations set up where they receive the blueberries. At these stations, the berries are weighed, cleaned and then shipped to a processing plant. All of the Nova Scotia production does not go through buyers. A considerable amount is grown by, or sold directly to, the processor, and some blueberries are sold fresh on the retail consumer market.

In 1993, 73 percent of Nova Scotia's production was processed by Nova Scotia processors, and about 26 percent was shipped fresh by buyers to processing plants outside Nova Scotia (mostly in the state of Maine). Local fresh sales accounted for less than 1 percent of total production.

Up until 1972, approximately 70 percent of the total Nova Scotia processed pack was usually sold to United States manufacturers, while the other 30 percent was sold to manufacturers in Canada. Beginning in 1972, increasing amounts of Nova Scotia berries were sold to European countries such as West Germany, Sweden, Norway and the Netherlands. From 1977 to 1982, over 60 percent of each year's crop was sold in Europe. Small quantities were sold in Japan in the late 1970's and this market increased steadily for about five years. Since then, there has been a leveling off of demand. Shipments to European markets declined substantially from 1983 to 1985 because of the strength of the Canadian dollar in relation to most European sales since that time. In most cases, shipments of overseas markets are made by refrigerated containers through the ports of Halifax or St. John.

### PRICES PAID TO GROWERS

YEAR	AVERAGE PRICE (cents/lb)	YEAR	AVERAGE PRICE (cents/lb)
1956	10.5	1974	18.5
1957	12.0	1975	26.5
1958	12.5	1976	32
1959	10.5	1977	62
1960	10.0	1978	50
1961	9.0	1979	38
1962	8.5	1980	45
1963	12.0	1981	48
1964	15.0	1982	60
1965	24.0	1983	40
1966	16.0	1984	30
1967	7.0	1985	25
1968	17.0	1986	45
1969	15.0	1987	60
1970	21.0	1988	60
1971	16.0	1989	60
1972	24.0	1990	42
1973	28.0	1991	55
		1992	50
		1993	25

Prices paid to the grower over the last thirty-four years are given as follows:

Prices over this period have fluctuated greatly from a low in 1967 of 7 cents to a high in 1977 of 62 cents. The average price per pound received by growers in the 1950's was 11.8 cents; in the 1960's; this rose to 13.4 cents per pound. During the 1970's, the grower price averaged 31.6 cents per pound; and over the ten year period from 1983 to 1992, the average grower price was 46.7 cents per pound. The average price over the five year period from 1988 to 1992 was 53.4 cents per pound. The price for the 1993 crop dropped dramatically to .25 cents per lb. due to an inventory carryover, increased competition from highbush blueberries, and a general down turn in the economy.

Beginning in the mid 1970's, a steadily increasing market demand was stimulated through promotional efforts in Europe and Japan by Nova Scotia's growers and processors, and promotion booth in North American and overseas markets by the North American Blueberry Council and the Wild Blueberry Association of North America. New markets in European countries and Japan lessened Nova Scotia's dependence on the U.S. market, and resulted in good prices to growers from 1975 to 1983. The lower prices in 1984 and 1985 resulted from inventory buildup from three successive high production years in most blueberry production areas of the world in 1983, 1984 and 1985. There is a continuing job to be done in selling blueberries in new market areas to cope with the rapid production increases which have occurred in both the highbush and lowbush industries in recent years.

# PROCESSING

There are two processing companies in Nova Scotia which freeze blueberries for resale to the manufacturer.

1) Cobi Foods Ltd.	Port Williams, Kings County, Nova Scotia
2) Oxford Frozen Foods Limited	Oxford, Cumberland County, Nova Scotia and
	Halfway River, Cumberland County, Nova Scotia

Both companies have Individual Quick Freeze (I.Q.F.) facilities in their plants and have access to adequate storage facilities to handle the amount of berries they process.

# **PROCESSING COSTS**

An explanation of costs involved in processing and marketing lowbush blueberries is given below. Various costing systems are used by different processors but it is generally agreed that total processing costs, excluding transportation, duty and brokerage charges, will run between 40 and 50 cents per pound. Transportation costs vary with production destination. Duty and brokerage charges are a percent of the selling price, and vary with it.

To illustrate the relationship of processing and marketing costs to finished product, consider the following example. If a processor pays 55 cents per pound for blueberries delivered to his plant, and his total processing and marketing costs based on the cost given above are 45 cents; then that processor must receive at least \$1 per pound for the finished frozen product. This would simply cover costs and not allow for transportation, duty and a margin of profit. A brief explanation of some of the processing and marketing costs is presented below to give an indication of various items which make up the total cost picture.

### SHRINKAGE

This item refers to the loss in weight due to dirt, small berries and other foreign material which is removed as the berries go through the cleaning and processing lines. The amount of shrinkage is variable but will usually run somewhere between 10 and 15 percent.

### **DIRECT COSTS**

- Labour (handling and inspection product as it moves from field or collecting station through the processing line and into cold storage)
- Storage
- Containers
- Electricity
- Taxes, Dues, Etc.
- Short Term Interest

### OVERHEAD

This item includes all equipment and facilities, maintenance and repairs, insurance, company administration, interest on financing, depreciation, etc.

#### **MARKETING COSTS**

### **DUTY AND BROKERAGE CHARGES**

These are a necessary part of the marketing process. They are calculated as a percentage of the selling price and vary with it. Duty does not apply to berries sold on the Canadian or U.S. market, but berries shipped to overseas markets may be subject to import duties as set by the importing country.

#### TRANSPORTATION CHARGES

These charges vary with the destination of the product but will generally run between ten and twenty cents per pound for overseas destinations.

# FOREIGN EXCHANGE

The strength of the Canadian dollar relative to the currency of the purchasing country is a cost which fluctuates on a continuing basis and can be an important factor in determining the price received for berries sold outside of Canada.

# **FRESH MARKETS**

A small percentage of the annual lowbush blueberry crop is sold each year on the fresh market. There are about a dozen commercial operations marketing fresh fruit in Nova Scotia. About 280,000 pounds were sold fresh in 1993. The fruit is packaged in either 10-pound boxes, 5-pound boxes or pint or quart containers. Sales are mostly to retail store chains or fruit stands. Some packers work with service clubs or other groups who sell 10 or 5-pound boxes of fresh blueberries as a fund-raising project.

Selling berries on the fresh market requires more labour and special materials and equipment to do a proper job. There is, however, a good opportunity for development of substantial sales if a producer is willing to expend some time and effort to set up an efficient operation, develop a marketing system and put out a high quality product.
