

Ingenuity at Dalplex

Late January there was a leak located in one of the roof air handling units that is critical to keep the roof from overloading with snow and caving in.

A team of steamfitters, instrument mechanics and welders sprung into action to identify, repair, and test the steam coil. The location of the work and scope of repair made this a very difficult job. This issue was a first of its kind as far as I am aware for Dalhousie. The ingenuity and teamwork of the group led to a safe and successful repair of the coil kept the roof in place, and allowed full return to operations at the field house.
